

Mothers Out Front

Mothers Out Front, a national organization promoting climate-safe schools, needed a tool to help advocates understand environmental conditions across schools and districts. Last quarter, the team created Climate Lens, an interactive dashboard that aggregates relevant data and produces composite measures of environmental conditions and improvement opportunities. This quarter, the team improved the dashboard's data processing efficiency and user experience.

As part of data processing refinements, the team built infrastructure to scrape environmental policies from an online source and classify them using a large language model. The team also removed redundant data operations and unnecessary files to optimize efficiency when running Climate Lens.

To enhance usability, the team added a feature allowing advocates to quickly access detailed information about any school by searching by name. Composite climate scores were expanded to track both relative and absolute environmental conditions. This system allows advocates to evaluate how healthy their school or district is and how they compare to others across the US. Informative tooltips and detailed explanation pages were also added to clarify each metric's meaning and relevance.

An example of the enhanced dashboard interface is shown in the figure below, illustrating how advocates can explore school and school district environmental metrics.
