

The University of Chicago Transportation Office operates the UGo shuttle system, which serves university affiliates in Hyde Park alongside the Chicago Transit Authority (CTA) bus system. Due to recurring budget shortfalls, the CTA is under consistent pressure to cut services, including the 171 and 172 bus routes which run through Hyde Park. With this in mind, the team projected changes in UGo shuttle ridership if the CTA bus routes were cut. The projections were based on historical CTA ridership data and the proximity of bus stops to UGo shuttle stops that operate in the same direction as the buses. The projected data was incorporated into a dashboard seen below, so that the transportation office can visualize the changes in ridership should the 171 and 172 be cut. On the dashboard, the size of each circle represents the base UGo ridership at that stop and the color represents the projected change in ridership, with the darker green being greater change. The work of the team this quarter has prepared the University Transportation Office for future budget cuts and identified the specific shuttle stops best positioned to absorb increased ridership demand should the 171 and 172 be eliminated
